7.2 Data sources

Excel spreadsheets

7.3 OPL in programming

Command line with data

The Concert-API, example: Java

icoa script

Model: Cyclic staffing problem

index sets:

T set of time slots

S set of shift patterns

parameters:

 c_s cost per employee in shift pattern $s \in S$

 d_t requirement of employees in shift pattern $t \in \mathcal{T}$

 a_{ts} Availability of employees in shift pattern $s \in S$ in time slot $t \in T$

decision variables:

 x_s deployed employees in shift pattern $s \in S$

model description:

$$\min \quad \sum_{s \in S} c_s \cdot x_s$$

s.t.
$$\sum_{s \in S} a_{ts} \cdot x_s \ge d_t$$
 $\forall t \in T$ (I)
 $x_s \in \mathbb{Z}_0^+$ $\forall s \in S$

Building a SheetConnection

The object data type SheetConnection connects to an Excel spreadsheet (MS Windows only)

Construction of a SheetConnection

SheetConnection name("path to spreadsheet");

Possible data types for reading and writing

- zero-dimensional data types, i.e. single variables. Reading data from one cell.
- one-dimensional data types, i.e. sets and single arrays. Reading data from a row or column.
- two-dimensional data types, i.e. double arrays. Reading data from a cell matrix.

Reading and writing with absolute cell adressing

7 OPI interfaces to other applications

> CC-BY-SA A. Popp

Excel spreadsheets

Reading with absolute cell adressing

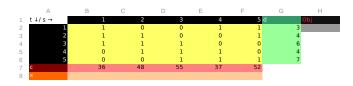

variable name from SheetRead(SheetConnection name, "table name! starting cells: ending cell")

Writing with absolute cell adressing

variable name to SheetWrite(SheetConnection name. "table name! starting cell: ending cell")

In example "Vindoo Support"

Excel spreadsheet for example "Vindo Support"

Excerpt from the data file

```
// SheetConnection
SheetConnection sheet("CyclicStaffingProblem.xls");
// index sets
T from SheetRead(sheet, "Data!B1:F1");
//parameters
d from SheetRead(sheet, "Data!G2:G6");
//decision variables
x to SheetWrite(sheet, "Data!B8:F8");
```

Reading and writing with named ranges

to other applications CC-BY-SA

7 OPI interfaces

A. Popp

Excel spreadsheets

In MS Excel it is possible to name cell ranges.

Reading with named ranges

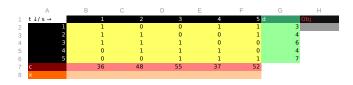

variable name from SheetRead(SheetConnection name. "range name")

Writing with named ranges

variable name to SheetWrite(SheetConnection name, "range name")

In example "Vindoo Support"

Excel spreadsheet for example "Vindo Support"

The yellow range is named "ParamA"

Excerpt from the data file

```
// SheetConnection
SheetConnection sheet("CyclicStaffingProblem.xls");
//parameters
a from SheetRead(sheet, "ParamA");
```

Building a DBConnection

The object data type DBConnection connects to a data base.

Construction of a DBConnection

DBConnection name("interface", "connection string");

Supported data base interfaces

- ► DB2
- Oracle (Version 10 und 11)
- OLE DB (MS SQL Server)
- ► ODBC (u.a. für MS Access)

7.3 OPL in programming sequences

Command line with data sources

The Concert-API, example: Java

7.3 OPL in programming sequences

- 1. Let P_1 be the LP relaxation of the cylic staffing problem. Solve P_1 , if solution is integer end, otherwise go to 2.
- 2.

$$\sum_{s \in S} x_s = \left[\sum_{s \in S} x_s^* \right]$$

to P_1 to get P_2 . If P_2 has a solution end, otherwise go to 3.

3. Add the constraint

$$\sum_{s \in S} x_s = \left[\sum_{s \in S} x_s^* \right]$$

to P_1 to get P_3 . An optimal solution of P_3 is always an optimal solution for the cyclic staffing problem.

he Concert-API, example ava

Preparations in the cyclic staffing problem example

Add the following constraints:

$$\sum_{s \in S} x_s \le ub$$
$$\sum_{s \in S} x_s \ge lb$$

If both bounds have the same value, the effective result is:

$$\sum_{s \in S} x_s = ub = lb$$

Advantages and disadvantages of the command line application

Advantages

- useable with any programming language, which supports command line applications
- quite versatile
- well suited for academic research and commercial prototypes

Disadvantages

- has to be combined with given data source interfaces or data input and output has to be coded seperately
- susceptible to error in platform configuration
- not well suited for productive systems

Class packages

ilog.concert classes providing interfaces to ILOG Concert ilog.cplex classes providing interfaces to ILOG CPLEX ilog.cp classes providing interfaces to ILOG CP Optimizer ilog.opl classes providing interfaces to OPL

7 OPI interfaces to other applications

> CC-BY-SA A. Popp

The Concert-API, example: lava

Important classes

IloOplFactory the central class for constructing other OPL objects

IloOpIModelSource a model file in the file system
IloOpIErrorHandler pipeline for output of OPL errors and
warnings (standard: System.out)

IloOplModelDefintion internal representation of the model IloCplex represents and instance of the CPLEX solver IloOplModel a problem instance IloOplDataSource data source for a model instance

7 OPL interfaces to other applications

> CC-BY-SA A. Popp

7.1 Optimization routine in OPL

7.2 Data sources

Excel spreadsheets

7.3 OPL in programming

Command line with data

The Concert-API, example: Java

LOG Script

Instantiating and solving models

Example: Cyclic-Staffing-Problem

```
IloOplFactory oplF = new IloOplFactory();
IloOplModelSource modelSource =
  oplF.createOplModelSource("CvclicStaffingProblem.mod"):
IloOplErrorHandler err = oplF.createOplErrorHandler():
IloOplModelDefinition def = oplF.createOplModelDefinition(
  modelSource, oplF.createOplSettings(err));
IloCplex cplex = oplF.createCplex():
IloOplModel opl = oplF.createOplModel(def, cplex);
IloOplDataSource dataSource =
 oplF.createOplDataSource("CyclicStaffingProblem.dat");
opl.addDataSource(dataSource):
opl.generate();
opl.getCplex().solve();
opl.printSolution(System.out);
```

7.2 Data sources

Excel spreadshe Data bases

programming

Command line with data

The Concert-API, example: Java

Accesing model elements

- access with class IloOplElement and method getElement(String s).
- data type translation with as-methods

OPL data type	Concert data type keyword	Java data type
int	Int	int
float	Num	double
string	Symbol	String
Set	Set	
Array	Map	
tuple	Tuple	
range	Range	
dvar	Var	
dexpr	Expr	

7 OPL interfaces to other applications

> CC-BY-SA A. Popp

7.1 Optimization routine in OPL

7.2 Data sources

Data bases

7.3 OPL in programming sequences

Command line with data

The Concert-API, example: Java

Define custom data sources

- ▶ abstract class IloCustomOplDataSource
- data delivery via customRead

Example: cyclic staffing problem

```
@Override
public void customRead() {
    //Initialize Datahandler object
    IloOppDataHandler handler = getDataHandler();

    //deliver ub
    handler.startElement("ub");
    handler.addIntItem(this.ub);
    handler.endElement();

    //deliver lb
    handler.startElement("lb");
    handler.addIntItem(this.lb);
    handler.addIntItem(this.lb);
}
```

ILOG Script

7 OPI interfaces to other applications

> CC-BY-SA A. Popp

ILOG Script

simplified syntax

based on Concert.

▶ OPL variables can be used like script variables

Scripts are written directly into to the model file execute blocks can be used in pre- and postprocessing

▶ ILOG Script is an extension of JavaScript

► The main block serves as procedure control. Here we can create and and solve problem instances.
